Personal Introduction & Course Expectations:

Hello, my name is **Hari Krishna Jadda**. Hailing from Inavolu, Guntur, INDIA. I'm eager to embark on the next phase of my journey by applying for a student visa to pursue full-time studies at the **University of Newcastle (Callaghan Campus)** specializing in their **Master of Information Technology** Program. This program will be instrumental in honing my skills and knowledge in the field of Information Technology, bringing me closer to my career aspirations.

Throughout my upbringing, my parents have been incredibly supportive. My father, **Mr. Satyam Jadda**, has excelled both as **a farmer and as a businessman**, while my mother, **Ramanamma Jadda**, not only managed our household but also operated her own business—a Floor Mill in our village. Meanwhile, my brother, **Mr.**

Haribabu Jadda, works as a **Cloud Migration & Imp Analyst** at **Accenture Solutions Private Limited**, has been a significant source of inspiration for me. His experiences and insights into the field have not only broadened my understanding of cloud technologies but also fueled my passion for pursuing a career in this dynamic domain. Observing his professional growth and the impact of his work has reinforced my decision to pursue a master's degree in Australia, where I can gain advanced knowledge and skills in this area.

My motivation to pursue a Master of Information Technology is driven by my deep-rooted passion for technology, fostered through a bachelor's degree in Electronics and Communication Engineering and enriched by **extensive IT experience**. Working on complex IT projects has sharpened my skills in **software development, network security, and data analysis**, revealing the transformative power of technology in solving real-world problems. To further specialize and lead innovative initiatives, I seek advanced knowledge and cutting-edge skills that the **Master of Information Technology** program at the University of Newcastle offers. This program's strong focus on practical application and industry collaboration aligns perfectly with my career aspirations of becoming a pioneering IT professional who drives technological advancements and creates impactful solutions.

Week 1:

Introduction:

As I have enrolled lately, I have missed the lecture of week 1, I have gone through lecture recordings and understood about the course outline, assessment criteria, expectations of course requirements. So, in the lecture there was a brief introduction of digital economy and deep explanation on history of ICT and digital disruption in terms of digital economy. And simple and clear explanation about the architecture of firms and markets. We were introduced to Tapscott's twelve key themes (2012) and we were suggested to have grasp on the topic. Additionally, I got to know about the management system and its hierarchy. I got to know that we have to write about creative destruction on the forum.

Week 1 Forum Activity:

Creative Destruction:

Creative destruction refers to the process in which old technologies or business practices are replaced by new and innovative ones. This process increase productivity resulting in long-term progress as it aligns with providing more convenient and efficient good or services creating new job opportunities, but it can also result in short-term disruptions such as job losses, decline of traditional industries or practices with concerns on data privacy and security.

Examples:

1. Web Development in journalism and entertainment:

Rapid advancement of web development has altered the operation of industries like journalism, entertainment. These days people prefer to get news from websites and social media instead of newspapers. Streaming platforms like Netflix, Spotify have taken over DVD rentals and radios. Amazon and Apple books have replaced bookstores by offering audio books and kindle books.

Why it occurred:

Online platforms are convenient and cost-effective as they allow users to read and entertain without visiting bookstores providing 24/7 availability anywhere from the world. These platforms use AI to analyse user behaviour and suggest articles, videos or music based on usage history enhancing user engagement and satisfaction.

How it affected:

Though it created many jobs in content creation, digital marketing and free lancing. Many traditional jobs in bookstores, retail sales, radio broadcasting, DVD rental stores and print publishing have been reduced in the past few decades.

2. Rise of technology in agriculture

Earlier farmers relied on experience, intuition and manual observation to decide when to plant, irrigate and harvest crops but now many farmers are using AI tools to analyse soil samples and global market trends to get suggestions for sustainable organic farming and timing of sales. Drones and sensors are used in scanning fields to get reports on pest infections. Autonomous tractors, seed planters and crop harvesters are widely used these days.

Why it occurred:

Rise of population and food demand, rising costs of fertilizers and pesticides, consumers prioritizing organic locally grown food and financial losses due to unpredictable market prices and supply, all these are driving farmers to adapt technology for sustainability and scalability.

How it affected:

Usage of AI tools in agriculture save time by giving more profits with less resources but initial investment and maintenance costs of these are high. Many traditional farming jobs are at risk. Data usage by tech companies raises concerns about data security. Over-reliance on technology can reduce traditional farming practices and may fail to predict extreme weather conditions.

Peer review I gave/received:

I do not have a review for week 1, as the forum was already closed before I joined the course late.

Reflections:

The course Enrolment was late, As I have enrolled for the course on 31st January 2025, I have missed week 1 and week 2 of lectures. So, I discussed it with my friends they guided me with the enrolment. I apologize for my late submission from My side, and this won't happen in the future as I will be up to date with my lectures and assignments. I have grasped few knowledge about creative destruction, generative AI. I gained the knowledge about the creative destruction and how I have used my examples from the web.

Conclusion:

After watching the week1 video lecture, I have learnt what is creative destruction and how it is transforming economic growth aligned with technological progress and the pros and cons of this transformation. Many sectors like art, commerce, medicine, transportation, agriculture…etc. have been adapting and innovating new technologies based on AI, real time data analysis and machine learning to increase

their productivity with minimum resources offering more efficient good and services. These innovations are more cost-effective, offer better accessibility, convenience thus improving user experience and satisfaction with reduced efforts. Technological growth has created many employment opportunities in Content creation, Digital marketing, Freelancing, Gaming, Animation, Telemedicine, E-learning platforms.

On the flip side, this rapid technological advancement also replacing traditional jobs and raising concerns on data privacy and security. Over-reliance of technology are making the humans lazy losing their creative mind and critical thinking abilities and are not reliable at extreme conditions as they can't act upon situation and may lack emotions and morals. The key takeaway is that creative destruction may provide long-term progress but can result in short-term disruptions as people need to put a lot of efforts in learning digital skills, work transition and may face ethical and economic challenges while trying to fit into the box.

Week 2:

Introduction:

The week 2 lecture focused on the twelve themes of the digital economy. The analysis includes description and explanation about economy, organization, technology aspects with several digital economy examples.

Week 2 Forum Activity:

Theme: Innovation:

In 2014, Tapscott emphasized on how the digital technologies are reshaping economic and business systems. In my opinion, innovation is the backbone of the digital economy as innovation is not only about new products and services, it also include the ways of thinking, organizing, and interacting. Innovation aligns with practical implementation of new ideas, methods, or devices which are AI and real time data driven, can act autonomously and make proper decisions based on complex data with minimal human intervention that result in more effective products and service with better user experience creating more business opportunities.

For Example:

1. Innovation in Digital Platforms like Uber and Amazon:

Traditional shopping needs a personal visit to physical stores and may offer limited selection. Traditional transport lacks safety, unsure of availability at times and has inconsistent pricing. But the innovation of platforms like Uber and Amazon have transformed transport and retail industry by connecting customers with providers via an app. Uber uses it's AI-driven surge pricing model to adjust the transport fares depending on the demand and supply ensuring maximum earnings and keeps track of the journey ensuring user safety. Amazon offers multiple range of varieties and uses real time data analysis to create personalized recommendations enhancing user experience and improving its sales.

2. Innovation in AI-Powered Technologies like Chat-GPT and Co-pilots:

Normally businesses depend on humans for customer support, content creation and for the development of software's. This needs a lot of efforts and time taking to analyse the complex data, refining content and deciding the correct approach. But now the usage of AI assistants has reformed various applications by reducing human intervention giving quick response. Businesses have started using ChatGPT for 24/7 automated customer support, for content creation and for marketing their product. AI copilots, such as GitHub Copilot and Microsoft Copilot help in reducing the efforts of developers by predicting code, reducing repetitive tasks and in data visualization there by improving the productivity.

Peer reviews that I have received:

Parth Patel

Reply from Parth Patel

- **Did the work describe and highlight the chosen topic?** Yes
- **Do you recommend any changes?** No
- **If no, why?**
  The work effectively explains innovation in the digital economy with clear examples and relevant references. It provides a strong argument, linking AI and real-time data to business transformation. The examples of Uber, Amazon, ChatGPT, and AI copilots illustrate the impact of innovation well. The structure is logical, and the references support the discussion.

- **1.Did the work describe and highlight the chosen topic? Yes. • 2.Do you recommend any changes? Yes**
- **3.If no, why?**

Hi Hari Krishna Jadda,

The explanation of the Innovation theme is very well explained. The examples you provided are also relevant. I also want to add that innovation is not just about the implementation of new ideas, methods, or devices but innovation goes beyond it, innovation also transforms existing businesses, methods, or devices. Companies don't just use new technology sometimes they use innovation to redesign their existing entire business model. You have mentioned the reference list, so it is also necessary to provide in-text citations.

Reply from Hari Krishna Jadda

1. Did the work describe and highlight the chosen topic? Yes
2. Do you recommend any changes? Yes

3. Yes, Why?

Hi Mohammed, I hope you are doing well. You have clearly explained what is knowledge, particularly about Digital Disruption & Agentic AI with very good examples. But, There is an additional recent(latest) research references required about AI in academic research and powered personal finance advisors because AI is growing very rapidly nowadays, you mentioned one

reference, it might be incomplete, more references would have been better. Thank you!

Reflections:

from week 2 task forum, although definition highlighted innovation in existing business. I could have given an example to illustrate how innovation transforms existing businesses alongside new idea implementation and should be added in-text citations along with reference list for all the references mentioned.

Conclusion:

Innovation is the driving force of digital economy which helped in reshaping various industries. Innovation doesn't just mean the development of new goods and services but introducing new ways of organizing, implementing or adapting trending technologies like AI, automation, machine learning and real-time data analytics. Organizations need to embrace continuous innovation to stay competitive in this rapidly evolving digital world and adapt to changing consumer needs to foster usercentric sustainable solutions which are smarter, fast, efficient and productive.

Week 3:

Introduction:

Strategic information system utilization stands as a vital requirement for businesses to achieve success as per third week's curriculum. And, Organizations must properly align business strategy, organizational design and IS strategy to attain competitive advantage according to this lecture. The instructional contents combine strategic

frameworks like Porter's Generic Strategies and SWOT analysis with optimal use of information resources and disruptive innovation understanding. Also, Strategic business adaptations together with information system implementation allow businesses to capitalize on market variations and develop innovative high-performance systems.

Task for Week3:

During this week I posted a draft of my Learning Journal within the discussion forum. The post consists of an introductory summary for Week 1-2 content alongside a description of the completed assignment then includes peer-reviewed feedback and personal thoughts about week activities and ending with main lesson learnings. The exercise targets the improvement of my Learning Journal format so I can obtain valuable feedback from peers. The peer review process is free to participate yet faculty encourage students to provide support, so others enhance their work. I should strive to encourage my peers by providing feedback to at least one student beyond just receiving it. Me and other students will obtain feedback which will help us understand better methods for organizing our Learning Journal Document.

Peer Review I have received for week3:

Eugene Lutton**(Lecturer)**

Reply from Eugene Lutton

Hi Hari

Good idea with headings with colour

References: Missing retrieved date for URLs, this needs correcting.

Peer review: None completed due to late enrolment.

Reflection: The idea is there but needs further details (linkage to you and the course and life) and length.

thanks

eugene

Reflections:

During Week 3, I learnt about Strategic Information Utilization in digital economies which integrates organizational structure with business plans and IT systems. The Information Systems Strategy Triangle demonstrated its value to me through its display of how IS strategies must always reinforce business-level objectives. The analysis of competitive environments through Porter's Generic Strategies and Hypercompetition Models enabled me to understand business adjustment methods

for handling fast-moving changes. I encountered difficulties while integrating certain frameworks to reality-based corporate situations especially during analysis of how smaller companies should compete with larger prominent organizations. The topic of disruptive innovation taught me new things despite my difficulty understanding how organizations execute simultaneous investments in dominant technologies alongside potentially disruptive technologies. Zara's implementation of IS for design provided me with better understanding of several concepts. however, I require additional practice before feeling comfortable in using these approaches. The lessons this week expanded my knowledge about strategic information systems, yet I understand I need to improve my ability to link theoretical models with real-world business strategies.

Conclusion:

My experience proved both difficult and fulfilling as it showed me why Strategic Use of Information holds its value in digital economy operations. My experience provided valuable understanding about Information Systems Strategy Triangle and disruptive innovation, but I had to overcome personal obstacles when managing my academic load with other responsibilities. The practice of dividing tasks into parts and learning to manage time better resulted in my ability to handle these challenges although I recognize that I must continue practicing these strategies. The difficult experiences from this week proved the necessity of resilient behaviour as well as adaptable strategies to handle complex strategies together with daily life commitments. Future development will focus on learning to enhance both my knowledge and skill in applying strategic IS structures.

Week 4:

Introduction:

The recent appearance of Deep Seek AI as a new generative AI provider creates an ideal opportunity to study Christensen's "Innovator's Dilemma." This discussion examines how Deep Seek uses its technical task focus with open-source creation to serve software developers by providing a budget-friendly substitute to established models such as ChatGPT which fits disruptive innovation frameworks. The analysis of DeepSeek's present status and future path allows us to predict how the disruptive

technology might defeat dominant market leaders while remaking AI domain patterns similar to other sectors where new disruptive technologies overtook corporate giants.

Task for Week 4:

New Gen AI on the block Deep Seek:

Discussion: How does the Deep Seek relate to the Christensen (2011) notion of The Innovator's Dilemma?

The Innovator's Dilemma tries to answer why successful companies often falter when confronted with disruptive changes in technology or market structure. Best business practices – like benchmarking the competition, investing in new technologies, and listening to the customer – can become stumbling blocks.

In his book, the only one is Professor Clayton. Christensen introduces the idea of Disruptive Innovation: a piece of technology or product innovation that cuts from the low-end market or emerging markets, the substance and performance of which may not be as good as that of mainstream products at the early stage, but it has the characteristics of being more cheap, simple and convenient, and gradually subverts the original market structure and challenges the hegemony of original monopoly. enterprise, and finally in the former is the king.

Numerous companies, including Playfish, Playdom, and Crowdstar, developed games for platforms such as Facebook and Myspace. The majority of traditional gamers, who typically purchased console games priced at $40 or $50, showed little interest in these offerings due to their significantly lower graphics quality and gameplay complexity. However, a vast number of new customers, who were not seeking high-end gaming experiences, were drawn to the simpler games available on Facebook and Myspace. This influx of users enabled these start-ups to enhance their products, ultimately encroaching upon the market share of established gaming companies. As a result, many traditional firms faced severe financial difficulties, with

some going out of business and others experiencing substantial declines in profitability.

Examples by comparing Deep Seek and ChatGPT:

Both Deep Seek AI and ChatGPT are better at different things and serve different purposes. Deep Seek, on the other hand, is centered around producing technical material, especially for software engineering, with an impressive programmer who can create code quickly and efficiently. While its open-source characteristic makes it a cheap option for developers, it lacks general knowledge, making it less capable of solving non-technical queries. Furthermore, Deep Seek is generally less chatty. It sacrifices Socratic with in favour of pragmatic answers, making it somewhat inaccessible for non-technical users.

On the other hand, ChatGPT was developed to cater to the general public, boasting extensive general knowledge and great conversation skills. Trained on data as recent as October 2023, it shines at nailing down natural, engaging conversations that can be useful for everything from customer service to content generation. However, while ChatGPT can code, it comes with caveats, including the need for far more context than a human coder, and it spits out factually incorrect solutions too. It comes with free and paid plans, but users might deal with premium pricing for complete access to advanced features and you will only have a small context window for long conversations. In general Deep Seek is for technical looking things and ChatGPT is for searching general things or engaging in conversation.

Hi Team,

1. **Did the work describe and highlight the chosen topic?** Yes
2. **Do you recommend any changes?** Yes
3. **If yes, what are they?** Yes

By showing how disruptive innovations disrupt established technologies your discussion effectively relates DeepSeek AI to Christensen's Innovator's Dilemma. The explanation of DeepSeek versus ChatGPT functions clearly demonstrates their different market applications for AI models. The gaming industry disruption example provides concrete evidence to support the argument since simple more affordable alternatives transform complete business sectors.

Your work features a strong point in outlining the distinct features between DeepSeek and ChatGPT. DeepSeek demonstrates both advantages and disadvantages according to your assessment which establishes its position as a disruptive innovation in AI development. Your research benefits from the application of Christensen's research to establish theoretical backing for your main points.

Your analysis would benefit from discussing possible future developments with DeepSeek as a technology. The disruptive innovation model shows DeepSeek starting in a special market segment before it could change dominant AI models. The argument would benefit from more depth regarding this particular point. A definitive declaration regarding DeepSeek's future influence in reference to The Innovator's Dilemma framework would enhance the reader's understanding of your main message.

This discussion provides well-organized content supported by effective illustrations. An enriched analysis and more solid conclusion would boost the quality of this writing.

You have a small typo in the 3rd reference. the retrieved year is incorrect.

Rahul Kumar - c3524646

1. **Did the work describe and highlight the chosen topic? Yes**
2. **Do you recommend any changes? Yes**
3. **If yes what are they?**

Hi Team, The article succeeds well in highlighting DeepSeek as an innovative AI model, dwelling on its cost-friendly, open-source approach and upsetting giants like OpenAI. It might improve, though, in discussing security better, providing clear examples of applications, and weighing the report by discussing restrictions such as scalability or ethical concerns. Additionally, a description of Christensen's Innovator's Dilemma and ensuring the accuracy of references would make it more understandable and credible. Overall, it's informative but needs to be more detailed and nuanced.

Reflections:

The focus of DeepSeek AI on technical tasks and open-source development aligns perfectly with disruptive innovation principles. The startup begins operations by focusing on software developers through a cost-effective and simpler option compared to established models such as ChatGPT. New emerging AI technology possesses the capability to compete against competing leaders by focusing on supporting a customer group that major companies have neglected.

Conclusion:

Similar to disruptive innovation paths DeepSeek shows potential to enter the broad AI market by developing and extending its technology capabilities. DeepSeek maintains specialized functions today but its open-source design with technical basis creates potential for enlarged operations and market disruption in the future. DeepSeek needs additional technological advancement together with improved user interface development to reach its ultimate potential. DeepSeek's ability to adapt and transform according to AI developments will determine its overall impact level.

Week 5:

Introduction:

During this week I studied business models within the digital economy through Rappa's taxonomy of internet business models and network effects and the distinct characteristics of durable digital goods including music and articles. The concept covers positive feedback mechanics together with switching costs and lock-in effects for competitive dynamics in addition to current Internet of Things (IoT) and Generative AI trends. The lecture analyses lock-in management and switching cost reduction methods along with different digital product sales approaches including download-to-own and music-as-a-service while presenting the economic Coase Conjecture. The educational material enables students to learn and put these principles into use for actual digital business situations.

Task for Week 5:

Assignment 2: Report 1

This research concentrates on Agentic AI as a leading modern artificial intelligence technology that operates autonomously with minimal need for human interaction during its choice-making tasks. The introduction section defines Agentic AI as a system made from large language models (LLMs) alongside reinforcement learning components that lets it transform in changing environments to fulfill set goals. Artificial intelligence began with rule-based systems that transitioned into present-day voice assistant and self-driving car technologies utilizing a perception management and planning and execution and feedback processing operational framework.

The report organizes Agentic AI system types into simple reflex agents and goal-based agents and multi-agent systems which it observes functioning across healthcare services and customer support services and content marketing operations. The report studies content marketing applications for specific markets and explains how these systems develop individualized approaches to generate specific campaigns. A discussion exists about ethical and legal concerns alongside security measures to evaluate improved efficiency and customer enhancement benefits alongside data security dangers and misinformation risks.

The report evaluates how Agentic AI disrupts digital operations through a breakdown which demonstrates both organizational benefits and drawbacks that affect operations while also endangering employment positions. Towards the end the report defines research priorities regarding governance structure development ethics while stressing the need for innovators to manage societal institutional obstacles. The analysis presents Agentic AI as an innovative industrial catalyst, but it needs proper risk oversight and management for successful implementation.

Reflections:

The study of digital economic business models this week delivered captivating insights to me. When I started this term with no AI background, I am now conducting research about Agentic AI and its operational principles. The power of AI systems to independently resolve problems while corresponding with real-world conditions remains incredibly astonishing to observe. The understanding I gained regarding network effects together with switching costs and lock-in mechanisms transformed my perception of typical business operations in markets.

Local businesses have caught my attention through their strategic digital approaches to compete better against their rivals in the market. Customers use a loyalty application maintained by a local coffee shop to generate repeated visits through this lock-in system. Spotify together with Netflix operate through subscription-based models which create barriers for users who attempt to shift to alternative platforms because of their establishment of switching costs. The food delivery apps Uber Eats and Zomato leverage network effects because their increased customer base and restaurant network strengthen platform value. The concept I learned in classes now makes me interpret my day-to-day social interactions in an entirely new manner.

During online shopping I observe how Amazon uses customized product recommendations which support data-driven business strategies. The ability of Facebook and Instagram to function depends on their advertising technology that relies on user-generated data for successful ad targeting.

The new way I look at things has unleashed curiosity within me to understand better how technology impacts our everyday experiences. The new perspective I've developed shows me how various businesses implement minimal digital strategies to retain their customers. I am astounded by the large amount of information I have acquired throughout these few weeks, and I am thrilled about continuing my investigation on these topics.

Conclusion:

Through this week I learned comprehensive knowledge regarding business models for digital economies that utilize network effects with switching costs and lock-in mechanisms to supervise operations. The study of Agentic AI became difficult but beneficial because I began the investigation without fundamental knowledge of AI

principles. These educational lessons helped me identify repeatable technological patterns through café loyalty programs all the way to Netflix and Amazon brand operations that use subscription models for user-specific recommendation generation.

My understanding of modern digital strategies in contemporary life has grown significantly after obtaining a new perspective. The academic learning experience enhanced my ability to evaluate digital business transformation together with building my self-assurance. Understanding business operations through technology evolved as an area of interest after taking this course because it revealed the real-life interactions of technology with daily business activities. The digital economy lessons I am taking fill me with enthusiasm since they will deepen my digital awareness.

Week 6:

Introduction:

This week 6 lecture introduced Trust as a fundamental component of human interaction required for teamwork while supporting communication activities and

competitive exchanges. Trust assumes a vital position in current business operations because digital transformation shifted people from face-to-face interactions to virtual digital networks. E-commerce modernization through social networks created new trust fundamental requirements because it adopted reputation systems and social presence together with a transaction security framework.

Higher advancement of technology will demand people develop deeper trust understanding because of human interactions. The requirements of survival and present difficulties in digital business operations together with human-computer interaction underline trust as vital for achieving system success and relationship development. This exploration delves into the foundations of trust, its role in internet transactions, and its future in an increasingly digital world.

Task for week 6:

There is no forum task in week 6. Our lab session focused on learning about both crucial digital economy trust fundamentals and the construction challenges of trust in AI systems along with trust-based relationships in digital environments. During digital network trust investigation we examined the distinction between social capital and trust before evaluating how artificial intelligence' utilisation interacts with trust through group discussions and activities. People need to learn ways to evaluate trust in online interactions while understanding how AI systems affect trustworthiness additionally, they should discover methods to build trust in AI systems. The session allowed us to advance our assessment of Agentic AI which facilitated dialogue regarding trust building mechanisms for digital systems.

Reflections:

The Trust in Digital Economy lesson this week showed me how trust functions in various aspects of life particularly among students. Managing numerous assignments with various deadlines produced overwhelming feelings which Reached their peak this week. My experience emphasized how essential it is for me to trust my ability to organize my time effectively since I handle multiple subjects and responsibilities at once.

Clear communication and reliability define success in peer review groups and group work activities. Consistent completion of my learning journal starting in Week 1 through Week 5 would have simplified my work process. The trust game together with MIT's Moral Machine exposed new perspectives which led to thoughts about digital and personal trust formation dynamics. Trust functions as an essential element which determines both academic teamwork success and online platform comfort and tool usage effectiveness for me during my student years. My future approach focuses on around improving my daily routines for journal maintenance and fronting up in collaborative tasks to develop confidence within myself.

Conclusion:

The lecture clearly explained trust as a vital component of digital economy operations. during the lecture while focusing on its use within virtual communications and platform architecture and between humans and computers. I learned more about trust formation and maintenance through participating in the trust game and using MIT's Moral Machine activities that explained human and digital trust fundamentals. I spent this week realizing the issues students face when balancing various commitments and the significance of developing faith in my ability to handle time management successfully. Updating my learning journal regularly will become essential to my success because neglecting this practice leads to last-minute stress. I will utilize these learned concepts to enhance my academic performance while creating better team dynamics with peers and handling digital spaces by implementing new trust-building techniques. The teachings from this week will prove essential for my scholarship along with my upcoming professional activities.

Week 7:

Introduction:

AI is game changer for our MIT student team and revolutionizing how we work together and address challenges. In this forum activity we will share the impact of AI on our team dynamics, and some real-world examples of its effects. Tools like Grammarly and ChatGPT have taken the legwork from us to write up reports, document code, and create presentations while GitHub Copilot was taking over the boring and repetitive parts of our coding and allowing us to focus more on the most creative and analytical side of our projects. Pilot programs have even begun testing next-generation platforms like Microsoft Teams, which uses smart algorithms to filter communications and suggest files and meetings, making our collaboration far more efficient than it ever was before. While AI has provided us with fruitful options in handling data using tools like Tableau, Power BI, Python, R among others in examining our records, identifying patterns within them, and creating predictions to help us make decisions. For the learning, AI had also been there with us—Coursera, Udemy, and Exercism had made our way of learning personalized, suggesting the right set of courses and introducing relevant coding challenges to us to keep us sharp and updated. And these AI tools haven't merely made us efficient but upended how we think through problems and create as a team.

Name: Hari Krishna Jadda/ **Student ID**: 3511138

Task for Week 7:

How has AI changed your team's life?:

Members

Thomas Phan - c3470524

Hari Krishna Jadda - c3511138

Shashank Dorepalli - c3506703

Prem Shanker Vanam - c3504807

Vignesh Karthik - c3512535

Discussion: In teams of approx. 5 discuss the topic and to enhance your post, provide real world examples

Being a team of MIT students, AI has changed the way we work, collaborate, and find solutions to various problems in the workplace. In this paper, we will discuss how AI has affected our team dynamics and the real-life examples of such impacts.

1. **Improved Efficiency**: Some of the AI-enabled tools that we have used include Grammarly, ChatGPT to write and structure reports, code documentation, and presentations; and GitHub Copilot to perform repetitive coding tasks, thus giving us more time to work on the analytical and creative aspects of the project.
2. **Collaboration**: Some of the AI-driven platforms we have been using include Microsoft Teams, a platform that uses intelligent algorithms to categorize conversations, sort notifications, suggest relevant files or contacts, set meeting times, send alerts, and monitor tasks.
3. **Data Analysis and Decision Making**: We are also able to analyze large datasets and derive trends from the data with the help of tools like Tableau and Power BI for our projects. Furthermore, using programming languages such as Python or R, we are able to analyze the data and look for patterns in the data set including customer behavior, trends and make predictions to inform business decisions.
4. **Training and skill acquisition**: Websites such as Coursera and Udemy use artificial intelligence to suggest course recommendations for users to enroll in to stay current with the latest information technology developments. Furthermore, one of the members has joined Exercism, a website that assists coding with AIgenerated tests that help solve coding challenges on a large number of exercises, which assisted us in ensuring that the code we wrote was efficient and complete, without missing any potential scenarios.

1. Did the work describe and highlight the chosen topic? Yes
2. Do you recommend any changes? Yes
3. If yes what are they?

Hi team,

Your work has depicted some important aspects of how AI helps us in the team environment. However, there are a few areas where clarity and further explanation will make your response more worthful. You have mention that Microsoft Teams as an AI-driven platform, but it would be helpful if you would elaborate how its AI functionalities differentiate it from other tools which categorize conversations and notifications using same simple algorithms.

Secondly, Tableau and Power BI statement does not clarify whether these tools themselves are considered AI or if they simply integrate AI-driven features. Lastly, examples of Coursera and Udemy focus more on AI's impact on organizations and businesses rather than your own experiences. It would be more relevant to include specific AI-driven learning tools or experiences that have directly influenced your team's skill development and specific AI-driven features would strengthen your argument.

The response mainly discusses how AI helps teams in general, but it does not clearly show how your team lives has changed due to AI. Including personal experiences—such as how AI has automated tasks, shifted team roles, or affected communication—would make your discussion more engaging and relatable.

Overall, your work is strong, but refining these points will make it more impactful.

1. Did the work describe and highlight the chosen topic? Yes

2. Do you recommend any changes? Yes

3. If yes, what are they?
Good job done team. However, there's no real-life example provided in your post, it's merely a theoretical discussion with nothing to back. It would be good to consider putting some real-life examples of what you're actually using and discuss the benefits and/or drawbacks on your team. The post is missing references and/or bibliography as well. Thanks!

Reflections:

Seeing how artificial intelligence has transformed the way we solve problems, cooperate, and develop personally is astonishing. While ChatGPT enables us to generate fresh ideas by meaningful discussion, Grammarly handles simple editing and formatting. With GitHub Copilot, we receive thorough information that lets us concentrate on developing state-of-the-art products in many areas. We are free to address the vital issues as these instruments take over more of the daily chores.

Conclusion:

In conclusion, artificial intelligence has totally transformed our team's operations. By handling monotonous, repetitive chores and improving communication and data understanding, this has assisted us in doing things quicker and more effectively. Though it is evident how much artificial intelligence has benefited us, comments from others reminded us to offer more personal anecdotes and clarify the actual

functioning of our tools. Forward, we will attempt to combine theory with actual life examples in order of interest and relevance of our narrative about the effect of artificial intelligence. Ultimately, artificial intelligence has transformed the way we work together, learn and think, as well as our productivity.

Week 8:

Introduction:

Two new work and business structures—namely the gig economy and the sharing economy—have transformed how people earn money and get goods. Where companies profit from temporary employees, the gig economy lets people seek flexibility and extra money by working short-term or freelance jobs. Ridesharing and food delivery applications are among the most used gig economy services. Conversely, the sharing economy seeks to link material resources by using Uber and Airbnb type sites to connect consumers with service providers. Both models present benefits in terms of cost and ease as well as legal and legislative issues across several markets.

Task for week 8:

Group task about **Sharing Economy and Gig Economy**

Team members:

Shashank Sunil Dorepalli - c3506703
Hari Krishna Jadda - c3511138
Vignesh Karthik - c3512535
Prem Shanker Vanam - c3504807

Gig Economy: -

The gig economy is an economic model that allows individuals to work in short term or flexible arrangements. It allows individuals to earn money through the provision of several parttime jobs or freelance employment.

Most social media platforms and mobile apps enable this kind of working arrangement and also support virtual currency systems. Under equitable work competition standards, online platforms or marketplaces act as middlemen who unite solo providers of services and buyers for a fee.

The short term nature is what characterizes the labor market of the gig economy. The term ‘gig’ originated from the informal terminology used by performing artists, such as comedians and musicians who receive a fees or payment for a single event but have no salary or income. In this economy, employees are not tied by long term agreements but instead work or ‘gigs’ project by project. Large corporate entities typically take advantage of these labourers for short term commitments, disturbing traditional marketplaces by offering alternative avenues of commercial services.

Gig economy workers are independent contractors, freelancers, project workers, and part-time or temporary workers.

They enjoy flexibility and better work life balance, while customers enjoy greater choice and convenience. Gig economy services are ride sharing apps like Uber and Ola, food delivery apps like Swiggy, Zomato, and Zepto in India, and Menulog, doordash in Australia. These apps provide consumers with on demand services like deliveries and short term availability of things.

Gig economy has enabled individuals to have opportunities to work as freelancers and part-time employees and earn extra income for themselves during spare time. The platform is increasingly popular because it is flexible and financially rewarding to the workers as well as the consumers.

Sharing economy: -

Sharing economy is a business model operated by platform providers that connect customers with the owners of goods or services. Unlike traditional business models, the sharing economy emphasizes the utilization of idle assets or resources.

Sharing economy platforms include, for example, Uber (ride sharing), Airbnb (holiday home rentals), and Airtasker (task services).

In the case of Airbnb, consumers can rent out houses or rooms for a limited period and pay for the service through the platform. Not all private sellers or platforms, however are part of the sharing economy. Consumers who access sharing economy platforms are typically protected by consumer law, such as the Australian Consumer Law, which safeguards their rights in case of disputes or issues.

UberX, for instance, has recently been legalized in NSW and ACT but is still illegal in Victoria and South Australia. This kind of discrepancy could potentially hinder the expansion of this economy, so the Labor government has created a set of National Sharing Economy Principles that would implement a flexible and equitable set of regulations across the country (Han, 2019).

Sharing economy has the benefit of providing cost savings, optimizing utilization, and optimizing availability of products and services. The customers are, for example, in a position to rent a room via Airbnb or find a service provider via Airtasker at the assurance they will be covered under regulations like regular transactions.

Manage Discussion by Shashank Sunil Dorepalli

Reply from Shashank Sunil Dorepalli

Team members:

Shashank Sunil Dorepalli - c3506703
Hari Krishna Jadda - c3511138
Vignesh Karthik - c3512535
Prem Shanker Vanam - c3504807

1. Did the work describe and highlight the chosen topic? Yes
2. Do you recommend any changes? Yes
3. If yes what are they?

The depth of the Analysis is well detailed with the examples but It Can be still elaborated more if we write more case studies and more examples it would be a good point. The flow and clarity of the discussion is good but it can be improved more .The conclusion part is a bit confusing it can be much more improved.

Reflections:

The sharing and gig economies have altered people's working patterns and the availability of services. This research has allowed us to see how these financial ideas provide flexibility, cost savings, and convenience not only for clients but also for staff. Still, their legal restrictions and perhaps their employment insecurity are known to us. The gig economy presents opportunities to finish small projects, although the sharing economy prizes efficient use of existing resources. Uber,

Airbnb, and food delivery apps have given us particular examples to help us understand society's dependence on these economies.

Conclusion:

The sharing and gig economies provide new possibilities for revenue and efficient use of services, respectively. For workers, they offer flexible job opportunities and for consumers they help people by improving access to many services. These models also create problems including conflicting rules and statutory prohibitions. As these economies progress together with developing technology, more discussions on enhancing labour rights and ensuring fair rules should follow. By and large, they show a tendency toward a more digital and interrelated economy.

Week 9:

Introduction:

Modern digital systems only work for organisations that base their competitive advantage on data management. Organizations gain their primary valuable resource by using transcendent analytics on Big Data to extract strategic insights from unprocessed information. The business analysis techniques include description along with diagnostics and predictions as well as prescriptions and big data refers to information volumes exceeding capacity and demonstrating velocity and value. The lecture demonstrated that organizations achieve performance upgrades and individualized client experiences through the union of analytics systems with big data technology to build exclusive answers.

Reflections:

The main point of this lecture demonstrated three forms of analytics starting with descriptive then diagnostic and finishing with prescriptive analytics. During this stage people establish a direct path between event understanding and decision-making followed by action determination. The utility of predictive and prescriptive analytics captured my attention because they enable organizations to gain foresight and act upon it effectively.

Another critical point discussed the five criteria known as the 5 Vs of big data. The inclusion of veracity and value within the big data ideas made a deep impression on me since these concepts were not in my initial understanding. According to Veracity principles data quality and uncertainty matter deeply for businesses since valuable data needs both valid source and context to become effective. Organizations need to move past data accumulation because meaning extraction from data is their essential priority. The successful conversion of data into valuable insight matches the fundamental principle that points to data on its own being useless while valuable wisdom makes the difference.

My analysis focused on the supporting technologies of big data analytics that consist of Hadoop and Spark and cloud platforms as well. The combination of my interest in AI prompted me to evaluate the potential for using these tools to develop autonomous AI systems that could learn autonomously while providing smart business support. Ethical concerns about privacy and security and data ownership created the need to ensure technical capability is properly governed.

Conclusion:

Business analytics and Big data is the foundation of intelligent decision making. It allows business to turn massive and complex data into meaningful insights that guide strategic decisions and operational improvements. As organisations adopt more digital tools and AI solutions the importance of data literacy and ethical data management will only grow, so leveraging analytics responsibly is not just about better performance but also innovative, equitable and forward thinking business practices.

Week 10:

Introduction:

These days, privacy is a big concern when it comes to digital life. The online world thrives on data, and that means our personal info gets collected whenever we use different platforms. A lot of times, this data gets used and sold without us really knowing about it. Shoshana Zuboff talks about this idea of “surveillance capitalism,” where our personal data ends up being traded to predict our behavior and make money.

Reflections:

The lecture made me think about how common data collection has become in our everyday lives. I used to just accept cookie pop-ups and terms of service without really checking what data they were collecting from me. But after learning about the imbalance of power between data collectors and users, I've started to see digital consent in a whole new light. It turns out many users aren't even aware of how much their data is being tracked, saved, and sold. This lack of clear information damages trust and true consent.

The mention of scandals like Cambridge Analytica really hit home, reminding me that privacy is not just a personal issue; it's something we all need to care about as a society. The lecture also got me thinking about what businesses and governments can do to help reduce privacy risks.

As someone looking to work with smart systems, I now feel a greater responsibility to prioritize ethical data handling. This means respecting users' choices, encouraging digital understanding, and backing policies that protect privacy.

Conclusion:

The digital economy brings a lot of tech improvements, but it also raises serious questions about personal privacy. To create a fair and inclusive future online, companies need to put clear ethical guidelines in place that focus on being open, getting consent, and being accountable with data. Keeping our privacy safe today isn't just a tech problem; it’s something that everyone—developers and regulators alike—needs to tackle together.

Week 11:

Introduction:

As part of a peer support group for INFT6060, my team and I put together a straightforward five-step guide for new students. We've looked at key things like getting to know the course structure, making good study plans, being active in discussions, working together in study groups, and reflecting on our learning. This guide is based on what we learned while going through the course ourselves and the common issues we faced.

Task for week 11:

Team members:

Vignesh Karthick c3512535

Prem Shanker vanam c3504807

Shashank Dorepalli c3506703

Hari Krishna Jadda c3511138

Processes to assist a future student in INFT6060

Team Support Post: Five Necessary Steps to Allow a Future Student to Excel in INFT6060
The following five-step plan is recommended by our team to allow future students to excel in INFT6060. The steps are designed to foster good academic practice and enhance comprehension and performance in the subject.

Step 1: Get to Know the Course Structure and Requirements
Students are encouraged to begin by reading the course outline and weekly schedule. Awareness of assessments, topics, and expectations enables planning (University of Newcastle, 2024a). Understanding Blackboard and Turnitin submission guidelines is likewise essential for academic integrity (Curtin University, 2023).

Step 2: Create a Weekly Learning Plan
Developing a weekly study timetable helps in managing workload and reduces stress levels during exams (Moss & Wilson, 2022). Utilization of applications like Trello or Google Calendar can help boost organization and assist in providing consistent progress in tutorials and assignments.

Step 3: Active Engagement in Tutorials and Online Discussion
Active engagement in tutorials promotes deeper comprehension through learning from peers (Biggs & Tang, 2011). Online discussion forum participation also helps to consolidate course concepts and facilitates peer-to-peer interaction (Salmon, 2000).

Step 4: Collaborate Through Study Groups
Creating or becoming a part of study groups can substantially enhance problem-solving and critical thinking skills (Johnson, Johnson, & Smith, 2014).
Peer discussion and review tend to make difficult concepts such as IT infrastructure and digital transformation easier to understand.

Step 5: Reflect and Seek Support When Necessary
Maintaining a reflective journal supports learning and connects theory and practice (Moon, 2004). Students are also encouraged to access Learning Development services for writing, referencing, or time management support (University of Newcastle, 2024b).
In undertaking these steps, students will be organized, confident, and academically successful in INFT6060.

Reflections:

Working on this peer support guide really helped me see how effective learning techniques work in college. I found that making a weekly plan (Step 2) changed the game for handling this course's workload. Plus, collaborating with others (Steps 3 and 4) offered me new ways to understand tricky IT topics. Step 5 is all about reflection, and I really connect with that; the times I took a moment to relate what we learned to real-world situations were the times I got it the most. I think our suggestions strike a good balance between staying organized and really engaging with the material, which helps with both the tough technical stuff and the bigger ideas in INFT6060.

Conclusion:

We're putting together a support system for future INFT6060 students that shows just how important it is to succeed in information technology studies. With our five-step approach, new students can set up a solid base and get engaged in their learning. Every student will have their own unique path in this course, but these

basic strategies can be adjusted to fit different learning styles. As tech and business change quickly, the skills they pick up from organized learning, working with others, and thinking about their experiences will help them not just in this class but in their careers too.

Week 12:

Introduction:

This week's lecture was a good review of everything we've talked about in class so far and gave us a look at what to expect for the upcoming exam.

Reflections:

In the last week of our course, we took a little break from the lab and went for a walk as a class. While we strolled, we chatted about different course topics before heading back to finish our forum activity for weeks 11-12. We focused on what advice we'd give to future students in the Digital Economy program. Our team worked together on this, and it was a good time to go over important ideas like Tapscott's 12 themes and different business models. This review really helped us get ready for the exam and solidify what we learned in the course.

Conclusion:

I've had some time to go over the Digital Economy concepts we've learned in the course. This review has definitely helped me get a better grasp on the material, and I think it'll help me do well in the exam coming up.

Final Conclusion:

What was the journey like?

The journey through this course has been both challenging and rewarding. Starting with foundational concepts like creative destruction and digital disruption, I explored the transformative power of technology across industries such as journalism, agriculture, and AI. Each week built on the last, deepening my understanding of strategic information systems, business models, trust in digital economies, and ethical considerations like privacy and surveillance capitalism. Collaborative projects and peer reviews enriched my learning, offering diverse perspectives and practical insights. Despite initial hurdles like late enrollment, I adapted quickly and remained engaged, culminating in a comprehensive grasp of the digital economy's complexities.

What about your expectations?

I came into this course just wanting to learn some tech skills about IT and digital systems, but it ended up being so much more. I didn't expect to dive into topics like the gig economy or Agentic AI and see how they really connect with actual business issues and ethical questions. I also found the focus on working with my classmates and thinking about what we were learning to be a game changer for me. By the time the course was over, I saw that it wasn't just about the tech itself; it was also about how it affects our jobs, economies, and everyday lives.

Did you use some of your learning in your workplace or life in general?

Sure! Here's a more casual version:

Definitely. What I learned in this course has changed how I think and act. For instance:

Strategic Frameworks: I used Porter's strategies and SWOT analysis to check out a family member's small business, and suggested some digital tools to help it compete better.

AI Tools: After our talks about Agentic AI, I started using GitHub Copilot for my coding tasks. It's really made me much more efficient.

Ethical Awareness: The lessons on privacy and surveillance made me more careful about how I handle data. Now, I always check app permissions and talk to my friends about being open about data usage.

Collaboration Skills: Going through the peer review process helped me get better at giving helpful feedback, which I've been using in group projects outside of class.

Course Feedback:

This course was really well put together. It mixed theory with practical use nicely. The weekly forums and group projects made learning engaging, and the feedback from the lecturer helped me improve my work a lot. I think it would be great to have a few more case studies or guest speakers from the industry to connect the theory with real-world situations even better. Also, having clearer guidelines on referencing early in the course would help sort out some minor formatting problems. Overall, INFT6060 was better than I expected, giving me useful knowledge and skills that I'm finding really helpful in my studies and everyday life.
